Ground And Surface Water Hydrology

Surface-water hydrology is the sub-field of hydrology concerned with above-earth water, in contrast to groundwater hydrology that deals with water below the surface of the Earth. Its applications include rainfall and runoff, the routes that surface water takes (for example through rivers or reservoirs), and the occurrence of floods and droughts.

Surface-water hydrology - Wikipedia

Groundwater, water that occurs below the surface of Earth, where it occupies all or part of the void spaces in soils or geologic strata. Groundwater plays a vital role in the development of arid and semiarid zones, sometimes supporting agricultural and industrial enterprises that could not otherwise exist.

Water supply system - Water supply system - Surface water and groundwater: Surface water and groundwater are both important sources for community water supply needs. Groundwater is a common source for single homes and small towns, and rivers and lakes are the usual sources for large cities. Although approximately 98 percent of liquid fresh water exists as groundwater, much of it occurs very deep.
