objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars, and galaxies. For objects governed by classical mechanics, if the present state is known, it is possible to predict how it will move in the future (determinism), and how it has moved in the past (reversibility).

Classical mechanics - Wikipedia

In Newtonian mechanics the concepts of space and time are supposed to be completely separable, and it is further assumed that time is an absolute quantity, susceptible of precise definition independent of the reference frame. It is also implicit in Newtonian

acceleration, $\mu(x)$ is an as-yet unspecified function (called the interpolating function), and a_0 is a new fundamental constant which marks the transition between the Newtonian and deep-MOND regimes. Agreement with Newtonian mechanics requires $\mu(x) \approx 1$, and consistency with astronomical observations requires

forces, including the special case in which a body remains at rest. Of first concern in the problem of motion are the forces that bodies exert on one another. This leads to the study of such topics as gravity, electricity, and magnetism, according to the nature of the forces involved. Given the forces, one can seek the ...

This is a simple Newtonian Mechanics problem. Details of the calculation: (a) Forces acting in the horizontal direction: (b) $F - T - f_1 - f_2 = Ma$, $T - f_2 = ma$. $f_1 = \mu(M + m)g$, $f_2 = \mu mg$. $F - ma - f_1 - 2f_2 = Ma$. $F - \mu Mg - 3\mu mg = (M + m)a$. μ
