A dynamical system describes the time evolution of a point in a geometry space, whereas differential geometry uses the techniques from calculus and algebra to study geometric problems (Marsden and Tromba, 2003). A vector field f takes coordinates x in a d -dimensional space as input and outputs a vector v in the same space; i.e., $v = f x$. With ...

The estimated higher-order vector calculus quantities closely matched the true analytically computed quantities (Figures 4D, 4E, and S4G). The analytical formulas of vector calculus that we derived lead to nearly 1,000-fold speedup than state-of-the-art numerical approaches that also require a reconstructed vector field (Figure S4H).

In physics, a force is an influence that can change the motion of an object.A force can cause an object with mass to change its velocity (e.g. moving from a state of rest), i.e., to accelerate.Force can also be described intuitively as a push or a pull. A force has both magnitude and direction, making it a vector quantity. It is measured in the SI unit of newton (N).
